

A stylish AVE solution to hide outlets for maximum protection

The AVE sliding front plates are able to match practicality and safety with an exclusive, original and customizable design, that is also coordinated with Ave Touch commands.

AVE offers a highly aesthetic solution to protect power outlets: the innovative Ave Touch "sliding" front plate range, that is developed to ensure greater safety for end users and children. With the same benefits, it's also possible to cover **USB, TV and SAT outlets**, or the socket for Aertecnica Tubò centralized vacuum systems compatible with AVE System 44.

In addition to being very practical and safe, this AVE solution exhibits a sophisticated and customizable design. It's possible to reproduce specific **inscriptions and symbols** in the centre of the plates themselves in order to immediately identify the "hidden" outlets and connectors in a highly aesthetic solution. The customization is made by laser technology. The installer can choose between an extensive catalogue of symbols and - in the case of logos or specific symbols - he can provide himself the graphic element. Optionally, it's possible to illuminate the symbols: a delicate **LED** will show the symbol of the socket outlet or connector, making it immediately recognizable even in the dark.

Perfectly coordinated with Ave Touch commands, the "sliding" front plates are available in seven different versions: in natural or anthracite brushed aluminium and in the glass models in clear black, white and gold, or in frosted silver grey and water green.

The refined design and the wide possibility of customization allow you to insert **Ave Touch "sliding" front plates** in any environment, like real integrated furnishing items, offering a cutting-edge solution for outlets' protection.
