

The AVE Domus 100 antibacterial range is born: with front plates, sockets, traditional and "touch" switches

Ideal for hospitals, clinics, RCI and schools, this range eliminates up to 90% of the bacteria present on the "contact" surfaces of the electrical system.

The **AVE Domus 100 antibacterial range** represents an effective response in all those places where there is the need to limit the proliferation of pathogenic microorganisms as much as possible. This solution is particularly suitable for any environment where absolute hygiene must be guaranteed because there are many components of the electrical system "intended" for mixed use.

It eliminates up to 90% of bacteria: thanks to a special silver ion additive inserted in the plastic mix that characterizes the range's products, it's possible to eliminate up to 90% of bacteria present on the "contact" surfaces of the electrical system. The devices of antibacterial range are made with Biomaster® technology. It's a silver ion treatment which is very effective against the bacteria's formation and proliferation on the surfaces of the products.

Both electrical system installers and designers have at their disposal **a complete antibacterial range**, that includes Moulded 44 RAL 9010 white front plates (coordinated with the rest of the range) and all the wiring accessories necessary for hospital facilities, retirement homes and related structures. The **Domus 100 series** welcomes the elements with antibacterial treatment, including various types of interchangeable rocker, sockets with Italian and German standards (also available in red version), telephone and data transmission sockets, TV and satellite sockets, dimmers, switches for roller shutters, etc.

The presence of **antibacterial "touch" switches** is fundamental: a product news increasingly requested by the market that allows to avoid contact with the plastic surface, further limiting the possibility of contamination.

The **AVE Domus 100 antibacterial range** is a complete proposal that meets all the needs of those who design and install special systems, where these features are essential. All supported by System 44 **aesthetics** and the **flexibility** of its universal support.
