

AVE video intercom system: IP indoor unit for concierge desks is now available

AVE is expanding its IP system with a desktop device ideal for access control and communication in residential and commercial settings.

The new **VIIP-GUARD indoor unit** expands the extensive range of the **V44-SMART IP video intercom system by AVE**. It's designed for managing calls at concierge desks.

Meant for desktop installation, it's ideal for manned concierge desks in residential and commercial settings. It allows access control for guests and visitors and direct communication with residents.

The VIIP-GUARD features a modern design, a large **10-inch touchscreen display** with a user-friendly graphical interface in four selectable themes, and a natural aluminum body. These features make the device easy to use and suitable for integration in a variety of contexts. The **integrated camera** allows residents to view the concierge operator on their internal monitor during calls. From the concierge station, operators can also view **IP cameras with H.264 streaming connected** to the system and make **calls to internal units** while showing the video stream from an IP camera connected to the system.

The device includes a **handset** to simplify use by the operator and ensure **conversation privacy**. It can **receive calls from external stations** belonging to the same system and manage **SOS alarm signals** from TS-SMART monitors in the apartments of the building. Thanks to the **day/night function**, calls are forwarded directly to the apartments when the concierge desk is unattended.

Installation is plug & play: it takes just a few steps to configure the device, which can be powered via a 48 Vdc PoE switch or a 24 Vdc switching power supply. **Multiple concierge units** can be installed, ideal for complex facilities such as **residences or office complexes**.

The concierge unit complements the other products in the AVE V44 SMART IP video intercom system. This range offers outdoor units for installations in everything from single-family homes to large apartment buildings. The lineup includes indoor units ranging from basic intercom handsets to TS-SMART monitors with 7", 10", and 18" LCD touchscreens. These monitors can be used to manage AVE Smart Home, wired home automation, and anti-intrusion systems.

AVE video door entry system: the answer to all your needs.

TECHNICAL SPECIFICATIONS:

- Power supply: PoE 48Vdc or 24Vdc switching
- Display: 10" touch screen
