

AVE toggle switches collections: new style combinations with aluminum front plates and cylindrical controls

The evergreen charm of aluminum enhances the electrical system through new design solutions, available in toggle-lever and windowed versions.

Launched in 2017 as an exclusive innovation for the Italian market, **AVE's toggle switch collections** anticipated a trend that has since become a sector must-have. This trend is now further reinforced with new proposals that combine aesthetics and functionality: AVE introduces its **new cylindrical toggle switches** and important updates to the **New Style 44** front plates.

The new AVE cylindrical toggle switches

AVE expands its range of **toggle switch controls** by introducing the new **metal versions with a cylindrical shape**; a proposal with a minimal design, ideal for contemporary electrical systems, available in three refined finishes: **satın gold, glossy dark chrome and antique bronze**. The controls, equipped with an illuminated indicator for visual feedback, integrate AVE's advanced technology, satisfying every need for traditional electrical systems. Perfectly compatible with New Style 44 front plates, the dedicated toggle switches and sockets enhance the system with an elegant touch, combining attention to detail and practicality.

New Style 44 aluminum front plates for toggle switches

The New Style 44 front plate range is enriched with the **new aluminum versions with brushed effect finishing in natural aluminum and anthracite colours**, which are added to the warmer tones already present such as bronze, gold, and antique bronze. The range is also expanded thanks to a new plate conformation equipped with a slot for control and a dedicated round socket.

Windowed aluminum front plates

The range of windowed plates also welcomes the **new variants with brushed effect finishing in natural aluminum and anthracite**, completing the colour offer together with bronze, gold, and antique bronze.

With these innovations, AVE further strengthens its offer of **aluminum front plates**, celebrating a material capable of combining **resistance and an ever-current aesthetic**. The introduction of the new **cylindrical toggle switches** and the updates to the New Style 44 collection enhance the possibilities for customizing environments, responding precisely to the requests of a market that elects **aluminum and toggle switch controls** as true contemporary must-haves in the electrical sector.
